With this implementation, we will be implementing the overall analytics for podcast like we did for call simulations:

- **Completion Rate**

- how many learners have **completed** listening to the podcast out of the learners assigned.
 - the definition of completed is same as existing in production currently

- **Total time spent**

- total time spent on the particular podcast

- **Avg. Time spent**

- what is the average time spent by each of the learners
 - calculated by dividing the total time spent divided by the number of unique learners who are either in progress or completed
 - Additionally, there will be graph in the UI that indicates the listen time across the entire duration of the podcast.
 - The logic and implementation will be the same as existing in Paperflite's - video asset analytics.
 - Note - engineering has currently flagged this will not be a part of the scope for the upcoming build due to the technical effort involved.
 - we will pick this up later as a separate task
