

Knowledge Assessment - Simulation

With this implementation, we will be introducing a separate parameter in the assessment framework for simulations.

Objectives

The objective is to validate knowledge of the rep in simulations and flag if they make any wrong statements i contradiction to a given knowledge base.

Implementation Criteria

- The knowledge base will a stream in Paperflite.
 - this will be configured in the backend for the current build.
 - all the assets within the stream i.e all file types that are supported by Seek should be indexed as the knowledge base.
- In the configured assessment framework, once a simulation is completed, there should now be the additional parameter - Fact Check.
- This parameter will list all claims that were made by the rep that either fully or partially contradicts the information in the knowledge base.
- The UI will list the claims with the following:
 - rep's claim along with time spent
 - why it is wrong as the rationale citing the knowledge
- There will be no limit in the number of claims that are listed in this parameter. All wrong claims should be listed.
- If there are no factually wrong claims made by the rep - the parameter by itself will not be visible in the evaluation report.

Note: This parameter will not have an impact on the score
