

Podcast in Course

With this implementation, we are introducing the ability to bring a podcast within a course.

Acceptance Criteria

Course Creation

- When a user creates a course, he will now in addition to being able to add lesson/assessment, will have the ability to add podcasts.
- Users will be able to add **only published podcasts** to courses.

1. When a course contains podcasts

Course assigned to a learner

- Anyone assigned to a course that has podcasts automatically gets access to those podcasts as part of that course.
- In the course outline, podcasts show up as modules with a clear status (not started / in progress / completed).

Podcast added to an existing course

- When a new podcast is added to a course, all current learners in that course see this new podcast in their course outline.
- If some of those learners had already completed this podcast earlier (in any way), it appears as already completed in the course.

2. When learners complete podcasts in different ways

Podcast completed inside the course

- When a learner finishes a podcast from within the course:
 - The podcast module shows as completed in the course progress.

- The podcast is treated as completed for that learner in both course and within podcast entity

Podcast completed outside the course (standalone)

- If a learner finishes a podcast in a standalone flow, and that same podcast is also part of one or more of their courses:
 - The relevant podcast modules in those courses are marked as completed.
 - The learner does not have to repeat the same podcast again just to finish the course.

Podcast completed before it was part of a course

- If a learner finished a podcast earlier, and later that podcast is added into a course they are in:
 - The podcast appears in the course as already completed.
-

3. When the same podcast appears in multiple courses

Same podcast reused in several courses

- If a podcast is used in multiple courses for the same learner, finishing it once (in any of those courses or standalone) counts as completed in all of those courses.
- Each course still reports that the learner has completed that podcast module, but the learner only needs to listen once.

Starting in one place, continuing in another

- If a learner starts a podcast in one course and later continues from another course or from the standalone podcast area:
 - Progress (for example, 40% listened) carries over.
 - When they reach the completion threshold, all relevant places (all courses and standalone) reflect that it is completed.
-

5. When podcasts are changed in courses

Podcast removed from a course

- If a podcast is removed from a course:
 - New learners in that course do not see that podcast as part of the course.
 - Current learners no longer need that podcast to finish the course.
 - Any previous listening and completion for that podcast remain visible in the standalone podcast's analytics.

Podcast deleted

- If a podcast is deleted:
 - It stops appearing in course for new use.
 - Courses that already use it can either continue to show it as "deleted" while keeping historical analytics data intact.
-

6. Permissions and who can see what

- A learner who is assigned to a course that contains a podcast has access to both:
 - course
 - podcast
 - A learner who is assigned who only to podcast does not have access to the course.
-

7. How podcasts affect course completion

- To complete the course, a learner must finish all required podcasts and other required items; optional podcasts do not block course completion.

Changes over time

- If a required podcast is made optional or removed from the course, future course completions no longer depend on it.
 - Past course completions stay valid and are not downgraded.
-

8. Reporting and insights

For each podcast

- You can see how many learners have access to it, how many completed it, and how long they took, regardless of whether they listened via a course or standalone.

For each course

- You can see, for each podcast module in that course:
 - How many started and completed it.
 - How it affects overall course completion rates.

For each learner

- The learner can see all podcasts they have access to, with clear indication of whether each podcast is part of a course, standalone, or both.
- They can see which ones are complete and when they completed them.

Scope Matrix

Skill Behaviour

Situation	What appears for the learner (skills & completion)	How skills behave
Podcast assigned standalone (not in any course)	Podcast shows as its own learning; when completed, it appears in "learnings completed".	Skills attached to the podcast are marked as achieved for that learner once the podcast is completed.
Podcast only embedded in a course (never	Learner sees the podcast only inside the course journey, not as	When learner completes the podcast inside the course,

Situation	What appears for the learner (skills & completion)	How skills behave
directly assigned)	a separate assignment in My Space. The podcast however shows up separately in learnings completed after learning completion.	the same podcast skills are marked as achieved, just as if it had been standalone. There is no impact on the courses tied to the course.
Podcast both assigned standalone and embedded in a course	Learner sees it as one standalone learning plus as a module inside the course.	Completing the podcast once -achieves its skills. Repetitive completion does not matter.
Learner completes podcast once, then encounters it again in another course	Second course shows the module as already completed within the new course.	No new skills, the skills were already achieved from the first completion.

"My Space" – assigned vs completed matrix

Situation	"Learnings assigned to you" (My Space)	"Learnings completed" (My Space)
Course with 5 podcasts assigned to learner; podcasts NOT assigned standalone	Shows 1 item: the course. No extra cards for the 5 podcasts, avoiding 6-item clutter.	When learner completes the course, and any podcasts inside it, the course appears as completed with the podcasts within it - should not be a separate card.
3 podcasts assigned standalone + same 3 podcasts also included in a course assigned later	"Assigned to you" shows: 3 podcasts + 1 course (4 cards). It does not duplicate podcasts for the course.	Completion list shows: 3 podcasts (once each) and the course.
Podcast only ever consumed inside a course (never assigned standalone, never visible outside course)	Before completion: only the course shows as assigned.	After completion: podcast now appears in "learnings completed" as its own completed learning, alongside the completed

Situation	"Learnings assigned to you" (My Space)	"Learnings completed" (My Space)
		course, since it gave skills and has its own analytics.
Learner is unenrolled from a course that contained podcasts	"Assigned to you" removes that course; no implicit podcast entries are added.	If learner had already completed the course/podcasts, their completed history stays. Course and its podcasts remain visible in "completed" as historical items.
Podcast assigned standalone, learner not in any course using it	"Assigned to you" shows the podcast as a single row.	Once completed, it appears under "learnings completed" as usual. If later reused in a course, it is still a single completed learning.

Time-spent & completion matrix (course vs podcast reports)

- Time spent on a podcast is accumulated across all contexts (inside any course and standalone).
- Time spent within course shows only the time spent within the course, time spent within podcast report shows aggregated time across touchpoints.
- Completion of a podcast is "global" per learner: once completed, it is considered completed everywhere.

View	What is shown	Aggregation behaviour
Course report for Course X containing Podcast P	For each learner, show: whether they completed the podcast, and total time spent on Podcast P inside Course X - is this possible? @Anant Bhat @Manuj Sharma	Time for this report can be limited to time spent when P was launched from Course X, but completion status is global (once complete, counts as complete for course logic).
Podcast P's own report (global)	For each learner, show: total time spent on P across all courses	Time-spent is cumulative from all entries (Course X,

View	What is shown	Aggregation behaviour
	and standalone; completion status; first completion date.	Course Y, standalone, etc.). Completion is shown once per learner; path/context can be a detail field.
Course report when learner had previously completed P elsewhere	Course shows P as completed for that learner almost immediately after they access or enrollment reconciliation runs, even if they did not replay it in the course.	Podcast's report shows that learner with total time spent (from earlier usage + any new course time), and the completion date (first completion).
Learner partially listens to P in Course X and finishes it later via standalone	Course X report shows: partial time spent in Course X + completion flag once overall completion is reached.	Podcast report shows total aggregated time (Course X + standalone) and completion. Completion logic depends only on total time, not where it came from.
Learner re-listens to completed P inside another course (Course Y)	Course Y report shows time spent in Course Y and the fact that P is completed in that course.	Podcast report total time increases (extra listening), but completion was already true; there is no second completion event, just more time spent.

Open Question

- If time spent is going to be aggregated - how does this affect course report time spent?
 - meaning if a learner has not spent any time on a course but has completed a podcast that is within it - will that time spent show up on the course report?

Ideal Expectation:

- Time spent data for a podcast within a course report should only be the time spent on the podcast within the course in that particular attempt.
