

Simulations in Course

Role of simulations inside a course

- Simulations are treated as a distinct assessment type focused on **applied skills and performance**, not just knowledge(existing assessments)
- A simulation like podcast can exist:
 - Standalone (assigned on its own with its own report), and
 - As a module inside one or more courses (contributing to course completion and course score).

Follows the same rules as podcast in a course

- only published simulations can be brought into courses.
-

2. Completion, scoring and “waiting” behavior

2.1 What “completion” means for a simulation

- Completing a simulation has **two stages**:
 1. The learner finishes the simulation experience.
 2. The AI finishes generating and finalizing the **simulation report and score** (may take time).
 3. The learner can exit the simulation screen even before the final report is generated.

2.2 Impact on course completion

- A learner can finish all course content (videos, readings, quizzes, simulations), but the **course’s final score and detailed report are only ready after the simulation report is generated**.
- Right after finishing the simulation run:

- The course can show **"Course completed – final scores pending simulation review"**.
 - There is a clear message that "Your overall course score and final report will be available once your simulation is evaluated."
 - Once the AI finishes processing:
 - The simulation score is added into the course calculation.
 - The course view updates to show the final course score and the full course report, including simulation details.
-

3. How simulation scores are treated vs knowledge tests

3.1 Distinct tracks: theory vs simulation

- Course UI clearly separates:
 - **Knowledge assessment score** (quizzes, MCQs – "theory").
 - **Simulation assessment score** (scenario-based, performance-based – "practice").
- In the course summary and learner report:
 - Show **two score lines** (at minimum):
 - "Knowledge score" (aggregate of quizzes/tests).
 - "Simulation score" (aggregate of simulations).
 - The simulation score is visually more prominent (e.g., larger, highlighted, or placed first in the "Assessment" section) to signal its importance.

(3.2 Contribution to overall course score - later scope?

- The course has a configurable scoring model, for example:
 - Knowledge assessments: 40% of overall course score.
 - Simulations: 60% of overall course score.

- The course score formula is clearly shown in the UI so learners understand **why simulation performance matters more**.
- If the course defines minimum thresholds (e.g., pass only if simulation score $\geq$ X%), this rule is clearly surfaced:
 - "To pass this course, you must achieve at least 70% in simulations and 60% overall.")

Not doing this now

4. Learner experience around simulations

4.1 Immediately after simulation run

- After submitting, the learner sees:
 - A confirmation that their simulation attempt has been submitted.
 - A clear status such as **"Simulation under review"** or "Generating AI report...".
 - User can end the course once every assessment and lesson is completed and end the course- the congrats screen will be displayed.
 - After user exists

4.2 When the AI report is ready

- Learner receives:
 - A notification (in-app and/or email) that "Your simulation report and updated course score are available."
 - The learner can now view

5. Course summary and final report for the learner

5.1 Layout and emphasis

The course completed page should clearly separate and highlight:

- **Overall course score**
 - mean of all of assessments - knowledge and simulation
- **Simulation performance**
 - Aggregated simulation score.
- **Knowledge performance**
 - Aggregated quiz/test score.
- **Time spent**

5.2 Handling the “pending” state

- While waiting for the AI simulation report:
 - The course overview clearly shows: “Completed – final score pending” or “Awaiting simulation evaluation.”
-

6. Manager/instructor and admin views

6.1 For instructors/managers

- For every course, they will be able to see the same as learner
 - average overall score
 - average overall simulations score
 - average overall knowledge assessment score
 - other cards like pass rate, time spent, etc. existing
- In the module breakdown, they will be able to expand on each of the assessments(knowledge and simulation and view detailed reports for the same)

- As per existing implementation, they will be able to filter down attempt-wise.

Scope Matrix

- **Skill Behaviour** - Same as podcast
- **UI and My Space Behaviour** - Same as podcast

Completion Behaviour

Situation	What counts as "completed" in a course	What counts as "completed" globally
Simulation S taken standalone only (no course)	Not applicable (no course).	Once learner completes S, it is marked completed for that standalone assignment.
Simulation S embedded in Course A, learner completes S inside Course A	S is counted as completed for Course A . Course A can use that completion for its own scoring and completion logic.	This completion appears in the global simulation report as an attempt, but does not automatically satisfy S for any other course.
Learner completed S standalone earlier, then later S appears in Course A	Learner must still complete S again inside Course A . Standalone completion does not auto-complete the simulation module for Course A.	Global simulation report shows both attempts (standalone and Course A) as separate rows, with context labels.
S embedded in both Course A and Course B, learner completes S in Course A	Only Course A treats S as completed for its own logic. Course B still shows S as not completed until learner completes S within Course B.	Global report shows attempts from both courses separately as they happen; no "one completion for all courses" rule.

Learner Retaking Simulations within Course

- For course report score calculation - only the latest completed attempt of the simulation from within the course will be considered.

- however, each completed attempt will be getting tracked in the Simulation master report.

Open Question

- **What about time spent in the retakes of simulation? Can time spent across attempts before final submission be counted?**
 - ideally should be taken in as time spent
- **Is retake simulation necessary within a course?**
 - assessments today once submitted do not have retake
