

Real call scoring - Zoom x Hubspot

With this implementation, we are implementing a combined integration with Zoom and Hubspot for the epic of real call scoring meaning:

- we will now be assessing real sales calls with the assessment framework that we use for call simulations

The implementation involves:

- Zoom integration - to fetch real calls
- Hubspot integration - to ensure fetched call is tied to an actual deal and thereby ensure only sales calls are picked and internal and other calls are avoided

Implementation/Acceptance Criteria:

Zoom integration

- The zoom integration will be a **user level integration**.
- Users will be able to see a toggle for allowing real call fetching access.
 - only when toggled on, real calls of that particular user from that Zoom account will be fetched.

Hubspot integration

- Existing Hubspot integration(for the account)

Technical Flow:

- Once a zoom meeting is completed of a user, through the zoom integration of that particular user triggers a webhook event 'recording transcript completed'
- From this event, we fetch the user id and the meeting id.
- The user id is checked to ensure if that particular user's zoom integration has allowed real call toggle.
 - If no, there is no next step.
- If yes, the meeting id is used to fetch the following details from Zoom:
 - meeting name,
 - invitee email

With the above steps, we have fetched meeting and meeting details from Zoom. The next steps are to ensure this is an actual sales meeting for us to assess the same.

- The invitee email is then taken and searched for in Hubspot contacts.
 - If there is no invitee email, we will look for participant email.
 - if there is no invitee email or participant email - we will ignore that call.
- If and only when there is no exact match of the email, we will match with domain.
- With the matched contact(s), we will look for open deals in Hubspot.
- If and only when there is an open deal with the matched contact in Hubspot in the sales pipeline - we will consider the call as actual sales call.
- If there are more than 2 current open deals with the matched contact(s), the call is technically mapped to both the deals - not solving for this scenario currently as the likelihood is less.
- The transcript is then fetched for that particular meeting from Zoom.
- The transcript is fed to our assessment evaluation.

- The assessment evaluation is received and stored.
- The assessment evaluation is to be fed into the mapped deal as notes in Hubspot.
 - implementation to be confirmed with Anton/ops team.

Note:

- For the initial rollout i.e for Paperflite main production account, only calls that have 'Guided Walkthrough/Access' in the name should be assessed - this is in order to ensure only discovery calls are assessed as our assessment framework is built for that usecase only.
- These conditions are to be soft conditions in the backend so that they can be customised later for each instance/account.
