

Microlearning - Phase 1

With this implementation, we will be getting into the micro/self learning space whereby learners i.e normal users will be able to create microlearnings on topics they want.

- Previously, only admins/content publishers could create simulations/podcasts - with this implementation, we will be democratising this capability - allowing normal users i.e reps to create learnings for themselves - learn what they want, when they want and most importantly, in the way they want.

Scope for Phase 1:

- User should be able to attach an asset and generate microlearning article
 - Content upload - same functionality and rules as podcast generation
 - Article generation - same functionality and rules as podcast generation
 - The 2 inputs required from the user side for an article generation are:
 - text document - example, Salesforce integration document
 - relevant learning objective query - example, I want to learn about the Salesforce integration
 - If the entered query is irrelevant to the input documents attached, article generation will fail and a relevant error will be thrown.
 - Please note that only queries with learning objectives will work fine - the module is not built to function like Seek with queries like Summarise this, give 10 key points etc. - these are article edit related queries and currently not in scope.
- The learning article will be a 1 pager document that will be broken down clearly into sections or topics
- Currently, there is no strict word count limit for the learning article generated
 - it is based on the input documents and the content within them

Next Phases

- Different microlearning modalities whereby reps will be able to consume the learning articles in:
 - podcasts/audio experiences
 - simulations that test them on the learning article
 - quiz on the learning article
- In the next phase, as called out above, learners will also be able to edit the learning articles the way they prefer - 'elaborate more on this topic, give it to me in 10 key points, etc.'
