Overview

This is the first phase of our larger AI search implementation.

Acceptance Criteria

- With this implementation, we will be implementing AI search within Manage Courses.
- Upon entering the search query, there will be the following steps i.e loading:
 - the keywords from the query will be extracted by the agent
 - the agent will pass on the keyword to atlas search
- Results from atlas search will be returned in the UI.
- Search will happen through match with/in the following points:
 - name of the learning
 - description of the learning
 - skills mapped to the learning
 - not in first iteration's scope
 - type of the learning
 - not in first iteration's scope

There will be 3 states:

- when there are results for the entered query
- when there are no results for the entered query
- when there are no results for the entered query, but the AI suggests relevant followup queries(keywords)
 - this state is not in the scope of first iteration
- The ranking of the search results will be in the following order i.e factors with the heaviest weightage:
 - name
 - description
 - skill
 - type

The combinations/partial match technicalities are to be same as followed in atlas search in Paperflite's Global search today.

- In the results screen today, the results can be mixed i.e podcasts, courses, simulations, etc. not in fixed section-like order like in Global search today.

MoM from connect with @Anant Bhat and @Manuj Sharma

- thinking steps
 - steps
 - visual and etc.
- Loading

- Results - with and without

- name
- description
- type
- skills

next phase:

- personas
- author
- status

Next:

- **My Learning**
- **Mobile**

- make the button clickable for recommendation

Search at 2 levels

- Perform human technology
- then
