

Error Screen - Podcast Generation

With this implementation, we will now be implementing an error state screen whereby we will instantly display to the users that asset(s) they have uploaded for podcast generation cannot have their text extracted and thereby podcast cannot be generated.

User Story

As a podcast creator, I want to be instantly notified when my assets cannot be processed for podcast generation so that I can instantly replace the asset or proceed with next steps instead of being stuck on the loading screen.

The below are the different cases that need to be handled with this screen:

1. Individual Asset Processing Failure (Single Upload)

Scenario 1: Single Asset - Content Extraction Failure

Given: User uploads a single asset

When: Content extraction fails (for example, OCR is not supported)

Then: System should guide user toward replacement solutions

Acceptance Criteria:

Error Detection & Clear Messaging

- System detects extraction failure
- Error classification:
 - "File doesn't contain extractable text"

Revised Error Display (No Retry Option)

- unable to extract text from "asset name"
- replace button(the failed asset will be cleared)

User Action Options

- **"Replace"** - Clicking upon it will open up the select asset slider again

2. Multiple Asset Upload - Mixed Success/Failure

Scenario 2: Batch Upload with Extraction Failures

Given: User uploads 5 assets

When: 3 succeed, 2 fail content extraction

Then: System shows status and replacement options

Acceptance Criteria:

Asset Status Grid (No Retry Buttons)

text		
Asset Processing Results (3 of 5 ready)		
✓	research_paper.pdf	(2.1 MB) - success
✓	meeting_notes.docx	(450 KB) - success
✗	scanned_document.pdf	(5.2 MB) - failed
✓	presentation.pptx	(12 MB) success
✗	photo_notes.jpg	(8.1 MB) - failed

Batch Action Options

- **"Continue with 3 Assets"** (Primary CTA) - Proceeds with successful extractions
- **"Replace Failed Assets"** - Opens replacement flow/add asset slider for failed items(the failed assets will be cleared)

3. Complete Batch Failure - All Extractions Fail

Scenario 3: Zero Successful Content Extractions

Given: User uploads multiple assets

When: All fail content extraction

Then: Block podcast generation and guide toward solutions

Acceptance Criteria:

Complete Failure State (Solution-Focused)procreator+1

text△ No Text Content Found in Any Files

We couldn't extract readable text from your uploaded files

Solution-Oriented Actions

- "Upload Different Files" - Clear all and open add asset slider
-
