

# Microlearning

## Phase 1 - Explore

| Intent                | Query                                          | Output                                                                |
|-----------------------|------------------------------------------------|-----------------------------------------------------------------------|
| Traditional Search    | negotiation 101                                | learnings with negotiation in title/description/skill, etc. metadata  |
| Information/Knowledge | what is negotiation                            | look through courses and stitch an answer for the question in text    |
| Learning generation   | I want to learn how to negotiate in 20 minutes | create a podcast as per constraints with information across learnings |
| Conversational        | Can you convert this into a audio lesson       | ,                                                                     |

- How do we handle the differentiation between these queries
- What are the different outputs we want in the first phase
  - podcast
  - flashcards
    - this involves creation which we agreed to not do in the first phase
  - simulation
    - this needs pre-requisite work where we first can mandate a set of assessment questions in a simulation and then can create objections in a simulation based on an attached asset(s)

## Access

- Are we giving the access to all users now to create learnings via studio tech

## Storage

- Where do these generated microlearnings sit?

- Where can the users access them for repeated consumption?

## **Course - Microlearning**

- Users to have the ability to convert a course that's assigned to them into a playlist of microlearnings / bite size learnings

In this case, do we tie the analytics together?

- if a learner completes these microlearnings
  - should be considered as completed the course and achieved the skills?

## **Feedback from last connect for Product Design**

- The UI should not look like chat but rather a learning instance like Medium.
- do not merge this with Seek directly - it will lead it to look like a chat window
- Make enough estate for a learning article on topic of interest in the UI.
- Figure out another way to handle seek queries i.e doubts on topic
- Figure out how and when to modify microlearning/regenerate and answer questions separately
- On the right panel along with end of article - include ability to convert into microlearning modalities - podcasts, flashcards, simulation, etc.
- On the right panel, include:
  - recommended learnings
  - related topics
- Need to collate history of my previous learnings - my previous micro learnings
  - build a separate page which includes history
- Need to display previous knowledge of the rep and teach accordingly

## **Agreed Previously**

- Make offline/download for podcasts

- Sources of knowledge for the microlearning
- Learning summary after a learner completes microlearning

## Open Questions

- Do we want a hybrid search: fast keyword search for known items (course titles, tags, deal names) plus semantic/ai search for conceptual queries like "how do I open a discovery call?" Or can they switch between keyword search and ai search
- should keyword search be the default, with an "Ask AI" mode for deeper, conversational answers? What is the priority - Keyword search (speed) or AI mode
- How should search behave in different screens: different behavior on "My Assigned" vs "Explore"?
- Do we visually separate results from the application (courses, simulations, podcasts) vs AI answer?
- Should AI search always show its sources? Sources would be the learnings in the platform

- When a user just wants a specific item ("Cold calling 101 course"), should the system detect this and prioritize exact matches over AI explanations?
- **Different outputs:**
  - Generate a new call simulation from search intent ("practice objection handling for pricing")?
  - Generate a micro-podcast (2–5 min) summarizing a concept?
  - Generate flashcards, checklists, or quick-reference scripts from longer courses?
  - Generate a text (conversational) which can be converted to a podcast via AI suggestions
  - Can a rep take any assigned course and ask, "Turn this into a 3-minute podcast"?
  - text-to-speech with multiple voices and languages so reps can choose tone, accent, and speed?
- AI can give suggestions based on intent: e.g., explain = text; practice = simulation; on-the-go = podcast; quick = checklist?
- Can there be a template library - restricting users to generate only certain microlearnings. And if we restrict them what is the output we display when they search something. Just a text, saying sorry or we show learnings from the existing content?
- Should coaches be able to approve or curate AI-generated microlearnings before they appear to all reps? For example, can all courses that have been assigned to a user be converted to a podcast or a simulation if the rep has asked so in seek. Would sales coaches have any say in this?
- Should every AI long-form answer offer:
  - "Summarize to 2-minute answer" and
  - "Listen as audio / mini podcast"?
  - /or should every AI answer have some suggestion based on user intent
- Can generated audio be saved separately? Where does it live - my list?

- Can AI search learn from rep behavior (role, region, win/loss data, recent calls) to prioritize results and suggestions?
- After a query like “what is cold calling,” should the system:
  - Answer,
  - Recommend a related simulation, and
  - Queue a short course or podcast episode?
