

Simulation - Foreign Languages

Overview

Users can now select a preferred foreign language when creating a call simulation. The AI prospect will converse in the chosen language, and the sales representative must respond and complete the simulation in the same language.

Acceptance Criteria:

1. Language Selection Option

- The simulation setup flow includes a new step to select a language from a predefined list (e.g., English, Spanish, French, German, etc.).
- The default language is set to English if no other language is selected.
- The chosen language is displayed clearly in the simulation overview before the call begins.
- The chosen language is also displayed in the UI cards across the platform for the simulation.

2. AI Prospect Behavior

- Once a language is selected, the AI prospect communicates entirely in that language including the initial greeting.

3. User Interaction

- The rep is expected to converse in the same language for the simulation to proceed smoothly.
- If the rep responds in a different language, the prospect is not supposed to bend to the same and must continue speaking in the foreign language.

4. Performance Evaluation & Reporting

- The system records responses and evaluates the rep's performance in the chosen language.
- Reports and feedback are localized according to the selected language or appear in English (configurable setting).
