

Podcast Enhancements

With this implementation we have implemented the following with respect to podcasts:

- Creators will now have the ability to select the max time limit duration for the podcast at the time of generation
- Creators will now have the ability to select the type of audio experience - Monologue(new implementation)/Conversational
- UX changes in the podcast generation flow
- Error handling during podcast generation
- Apart from the above, we have technically optimised the creation flow in order to reduce the time in podcast generation as a whole.

Acceptance Criteria

Podcast Creation

- The podcast creation flow will now be the following:
 - upload assets
 - set max duration and choose audio experience

Default settings:

- **max duration** - default - meaning optimised based on the content uploaded as existing today
- **audio experience** - conversational
- The max duration setter's functionality will be the same as existing today in edit studio as existing.

Podcast Generation

After the podcast creation i.e after clicking 'generate now' button, user will enter the generation screen.

The generation flow will be as follows:

- Topic generation
- Transcript generation
- Audio generation

Additional File Format Support

- We will now also support link assets for podcast creation.

File Limit

- There will now be an upper limit for the number of assets that can be used for podcast creation - 5 assets.

UX

- User will be able to see 2 tabs - 'Details and Transcript'
 - by default landed onto the details tab
 - the transcript tab will be disabled until transcript generation is complete

Details

- There will be a skeletal loading while the topic generation is complete.
- Upon completion of topic generation, the topics will be listed within the details tab.
- A textbox will also appear for the user to add a description for the podcast above the topics listed.
- User will be able to scroll through the topics.

Transcript

- This tab will be clickable/openable only after transcript generation completion.
- The entire transcript of the podcast will be displayed.
- User will be able to scroll through the transcript.

Audio

- After transcript generation completion, the audio generation loader will appear at the bottom of the screen - as existing.
- Upon audio generation completion, the loader will convert to the audio player as existing with the playback functionalities as existing today.

Edit Studio

- Creators will now also have the ability to change the type of audio experience from edit studio.

Error Handling

- With this implementation, we have also implemented error handling screens.
- After clicking on generate now, before topic generation, if any asset fails in processing, we will be throwing an failure error.
- In the UI, there will be visibility into which asset(s) have failed.
- User will be able to either retry or replace the asset(s).
- Clicking upon the retry will retrigger the generation flow.
- Clicking upon replace will open the add assets slider again where there will be clear indication of which assets have failed for the user to remove them and replace with other assets.
- The error handling is to apply even in edit studio.
