

Microlearning - Podcast

Problem Statement

- Microlearning today only supports one format — the article
 - We want to let reps generate a podcast version of their microlearning article
 - The platform already has a podcast feature, but it is manager-created and public to the whole team — this new podcast is rep-created and fully private
 - These two are fundamentally different and must not be mixed together
-

Scope

In scope:

- Rep can trigger podcast generation from within their microlearning article/master prompt
- Audio is auto-generated from the article text (article gets uploaded as the asset for podcast generation)
- Podcast is private — visible only to the rep who created it
- Deleting the microlearning deletes the podcast too.

Out of scope:

- Reps sharing their podcast with teammates
 - Managers seeing what podcasts reps have generated
 - Any connection to the existing public podcast feature in [coaching.courses](#)
-

Acceptance Criteria

- Users in microlearning article generation will now be able to see podcast option on the right.
- Upon clicking podcast, user will be able to choose type and duration of podcast.

- User will be able to generate post selection of podcast type and duration.
- Post generation, user will be able to listen to the podcast and also view the transcript.
- When the user goes back and comes, progress should be remembered.
- In the microlearnings list, podcast icon should appear only if podcast is generated.
- Deleting a microlearning will also delete podcast along with it.
 - there will be no capability to delete a podcast alone

Recommended Technical Architecture

Data storage:

- The microlearning document already holds a learningModalities array — today it has article, we add podcast as a second entry in that same array.
- Article remains the source of truth -podcast is a derived format generated from it.
- No new collection or separate database entity needed — podcast lives inside the microlearning it belongs to

Audio file storage:

- Stored in our existing file storage (S3) under a private, rep-specific path

What this architecture enables for the future:

- The learningModalities array pattern means adding new formats (video, flashcards, quizzes) is an extension, not a redesign
- Each new format simply becomes another entry in the array alongside article and podcast
