

Call Classification

With this implementation, we will be productionizing data team's Call Classification code.

Problem

- With the fireflies integration, all of the account's calls are going to be fed for call assessment and additionally all of them are going to be assessed with the same framework.

Objective

- With this implementation, we are aiming to solve for this by introducing a AI layer that will classify calls as to what type of call they are so that we can weed out assessing internal calls breaching security.
- Additionally, we will also should be able to be able to have different assessment frameworks configured for the different type of calls.

Acceptance Criteria - Technical flow

- From the fireflies calls that come in via the integration, we will initially pass it through this AI layer.
- For Phase 1, we will pick the calls that have discovery sales call tagged with it and only pass that to assessment with our default scorecard MEDDIC -

Discovery Scorecard.

- All the other types of calls are not to be fed into the Call Library.
- This implementation is specific to the Paperflite account - the implementation should be done in a way such that this instruction is personalised for each account.
- The engineering implementation has to be done in a way that for each account, there are certain call types configured and only those calls will be passed on for assessment and to the call library via Zoom/Fireflies/Team integration.
- The engineering implementation has to be done in a way that in future we can keep adding call types and ability to map respective assessment framework to each call type.
 - please note that call types can differ for each account
- The classified call type should also be shown as a UI tag in the call library attached to the call.
- The call classification process should also happen in the case of upload call in simulation extraction.
- The call classification process should also happen in the case of manual upload in call library.
 - however, assessment can happen with the default framework and it can get listed in call library even if it is not discovery call.

Paperflite Sales Calls - Prompts

DISCOVERY CALL

PRIMARY INTENT:

To understand the prospect's business context, goals, pain points, current processes, and evaluation criteria before proposing a tailored solution or determining product fit.

REQUIRED SIGNALS:

- The sales representative asks exploratory questions about the prospect's business, workflows, or current tools (e.g., questions about team size, current processes, tech stack, content usage, or campaign setup).
- The rep attempts to uncover pain points, goals, or evaluation criteria before recommending a solution (e.g., asking what the prospect is currently exploring or what challenges they face).
- The conversation includes open-ended diagnostic questions designed to gather context rather than immediately pitching a product.
- The prospect explains their current situation, challenges, or objectives in detail (e.g., discussing marketing maturity, campaign workflows, or internal team structure).
- The rep may give a high-level overview of the company or product to establish context, but the core of the call focuses on understanding the prospect.
- Early-stage qualification signals appear such as:
 - team size
 - existing tools or platforms
 - use cases
 - budget expectations
 - timeline or evaluation stage.
- The rep may outline a loose agenda such as learning about the prospect first and then optionally showing examples or scheduling a deeper demo later.

EXPLICIT EXCLUSIONS:

- Calls centered on technical implementation, integrations, or onboarding planning (Implementation or Technical Call).
- Calls between internal team members discussing deals, strategy, or operations (Internal Call).
- Calls primarily about troubleshooting product issues or customer support (Support Call).

COMMON FALSE POSITIVES:

- Qualification or screening calls where the sole purpose is to verify basic fit (e.g., budget or role) without exploring business challenges in depth.
- Product walkthrough calls labeled as “discovery” but dominated by feature explanations rather than investigative questioning.
- Follow-up calls where the rep and prospect have spoken before and the call opens with references to a prior meeting, previously shared materials, etc.

PRICING CALL

PRIMARY INTENT:

To discuss the commercial terms of a potential purchase, including pricing structure, licensing models, discounts, budget constraints, and financial approval considerations prior to closing a deal.

REQUIRED SIGNALS:

- The conversation explicitly focuses on product pricing, plans, licensing tiers, or cost structures (e.g., per-user pricing, platform fees, onboarding fees, or bundled pricing).
- The sales representative explains pricing tiers, packages, or subscription models and what features are included in each plan.
:contentReference[oaicite:1]{index=1}
- The prospect asks questions about pricing details such as:
 - per-seat or per-user cost
 - platform or onboarding fees
 - licensing levels (read-only vs full access)
 - payment structure (annual, monthly, installment)
- Budget discussions occur, including statements about what the company can afford, comparisons with existing tools, or internal budget constraints.
:contentReference[oaicite:3]{index=3}
- The sales rep proposes discounts, special offers, competitive pricing, or volume-based pricing adjustments. :contentReference[oaicite:4]{index=4}

- The prospect discusses internal purchasing considerations such as approval processes, contracts, procurement timelines, or financial justification.
:contentReference[oaicite:5]{index=5}
- The discussion may include comparisons with competitor pricing or existing vendor costs to evaluate the financial viability of switching tools.

EXPLICIT EXCLUSIONS:

- Calls primarily focused on understanding the prospect's needs, pain points, or business challenges (Discovery Call).
- Calls centered on demonstrating product functionality or walking through product capabilities (Demo Call).
- Calls focused on technical implementation, integrations, onboarding, or system architecture (Technical / Implementation Call).
- Internal team discussions about deal strategy or forecasting (Internal Sales Call).
- Calls primarily troubleshooting product usage or customer issues (Support Call).

COMMON FALSE POSITIVES:

- Late-stage demo calls that briefly mention pricing at the end but mainly focus on product functionality.
- Procurement or legal review calls where contract terms are discussed without meaningful pricing negotiation.
- Discovery calls where the prospect asks a quick pricing question but the core conversation remains focused on needs assessment.

Please note, I will continue to add the prompts for 1-2 other call types. However, that is not a blocker for the Phase 1 rollout.
