

Live call help

1. Business Goal/Objective

- Build a **Live Call Assist AI** that listens to sales calls in real time and help reps.
-

2. Core Problems in Live Calls

2.1 The Five Distinct Problems

1. **Knowledge recall** – “I don’t know the answer to this question.”
2. **Discovery coaching** – “I don’t know what to ask next.”
3. **Objection handling** – “I’m not sure how to respond to this pushback.”
4. **Buying signal detection** – “I might be missing moments to close or advance.”
5. **Script / compliance adherence** – “I forget required points / legal language.”

2.2 Who Feels What

- **AE**
 - Knowledge recall, technical Q&A, objection handling
 - **Junior AE**
 - Discovery coaching, “what to ask next”
 - **Call center / support agent**
 - Technical Q&A, product knowledge, Script/compliance adherence, risk language
-

3. How AI Listens to the Call

3.1 Options

A. Bot joins the meeting (Zoom/Teams participant)

- AI joins as a visible bot participant.

- Gets clean, mixed audio from the platform.
- Typical latency: **~2–3 seconds** end-to-end.

B. Browser/desktop audio capture (local)

- Desktop app or browser extension captures system audio.
- Processes locally and/or streams to cloud.
- Typical latency: **~1.3–1.8 seconds** with optimizations.
- Requires deep OS permissions and careful handling.

3.2 Bot vs. Browser/Systems Capture – Comparison

Dimension	Bot-Joined Call	Browser tab / Desktop Capture
Time to ship	High	Moderate
Latency	2–3 s	1.3–1.8 s
Audio quality	Very high	Good
Reliability	High	OS/device dependent
Security / compliance	Clearer (bot + consent)	Grayer (local capture semantics)

4. What AI Actually Does During the Call

4.1 Types of Guidance

- **Informational:** "Prospect mentioned competitor X; here's the battlecard."
 - answers to technical objections, etc.
- **Prescriptive/Assistive:** "Say this next", "Ask this question."
- **Passive:** Transcription, metrics, and logs with no active suggestion.

4.2 Typical Real-Time Behaviors (Across Products)

- **Knowledge / answer surfacing**
 - When prospect asks: "How does your API handle X?"
 - Panel shows: Key bullet points + doc/case-study links.
- **Objection-specific responses**

- Detect "pricing is high" → show price objection rebuttal + ROI case.
 - **Next-best question**
 - Detect missing MEDDPICC fields → suggest specific question (e.g., "Who else will be involved in the decision?").
 - **Behavior nudges**
 - Talk ratio alerts, "slow down", "ask open-ended question".
 - **Risk / buying signal highlights**
 - "Budget concerns detected", "implementation timeline mentioned – potential buying signal."
-

5. Training & Intelligence Layer

5.1 Data Sources That Power Suggestions

- **Static knowledge base**
 - Product docs, FAQs, internal wikis, PDFs.
- **Uploaded sales playbooks**
 - Objection scripts, discovery frameworks, talk tracks.

The above is very important and critical - content setup.

Additional layer for training:

- **CRM data**
 - Deal stage, prior conversations, industry, persona.
 - **Past call transcripts**
 - "What top reps said when they won."
 - **"Best rep" patterns**
 - Language, sequence, and responses correlated with wins.
-

6. UX - Critical

6.1 Core UX Patterns

- **Floating side panel**
 - Slides in with suggestion; auto-hides after a few seconds.
- **Inline transcript highlights**
 - Key phrases underlined or color-coded in live transcript.
- **Discreet nudges**
 - Small banners or icons saying “Ask about budget now”.
- **Cue cards**
 - Full cards with Q&A, talking points, and “mistakes to avoid”.

6.2 Critical Points based on user feedback research

- Reps can only handle **limited stimuli** while talking.
 - Good patterns:
 - 0–3 meaningful prompts
 - Clear, short suggestions
 - Strong visual hierarchy (headline + 2–3 bullets).
 - Auto-dismiss and easy to ignore if not needed.
 - Bad patterns:
 - Continuous pop-ups and alerts.
 - Long paragraphs of text.
 - Suggestions that obscure prospect’s video or slides.
-

7. Risk & Failure Modes

7.1 Typical Failure Modes

1. **Wrong answer**

- AI suggests outdated/wrong product info.
- Fix: Show source, version, and confidence; allow rep correction.

2. **False objection detection**

- Mislabel enthusiasm or neutral comments as objections.
- Fix: Conservative thresholds, sentiment + context, visible confidence.

3. **Slow suggestions (latency)**

- Suggestions arrive after the moment has passed.
- Fix: Pre-compute/lookup whenever possible; streaming responses.

4. **Privacy/compliance issues**

- Sensitive internal data appears on screen.
- Fix: Data classification, masking, access controls, explicit consent.

5. **Rep over-dependence**

- Reps stop learning and rely fully on the AI.
- Fix: Limit prompts over time; complimentary post-call coaching.

7.2 Positioning AI as “Assist” Not “Control”

- Language in UI:
 - “Suggested response” vs. “Say this.”
 - “You may want to ask...” vs. “You must ask...”
 - Always allow:
 - Ignore/dismiss suggestions.
 - Feedback on quality.
 - Manager control over what is enabled.
-

8. Technical Architecture

8.1 Core Pipeline

1. **Audio capture** (bot or local)
2. **Speech recognition**
3. **NLP + classification**
 - Detect objections, topics, sentiments, entities.
4. **Context lookup**
 - knowledge base, playbooks, past calls.
5. **Response decision**
 - Rules / templates / RAG / LLM.
6. **Delivery**
 - Real-time push to in-call UI.

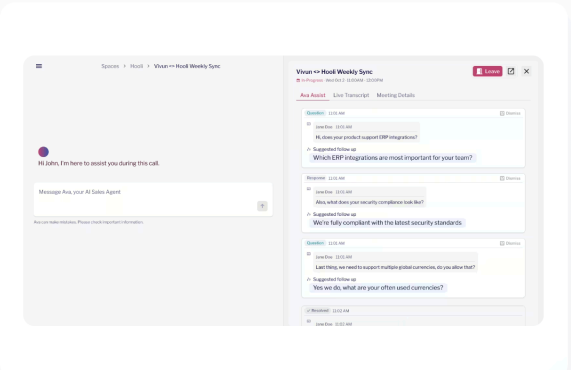

Suggested Phase 1 - low fidelity to demo

- Audio capture
- Identify knowledge objection
 - could be feature question/technical API question
- Go through indexed content and instantly show response
- Or suggest questions or talking points based on sales methodology/Vinoth approved checklist

Researched Products

Vivun

<https://www.vivun.com/call-assist>

Answer Technical Questions Instantly

When complex product or technical questions arise, Ava delivers clear, accurate answers in real-time. You maintain credibility and keep the conversation moving forward without waiting on subject matter experts. Choose to use Ava's guidance privately or let her respond directly to prospects.

Poised

<https://www.poised.com/blog/elevate-sales-call-performance-with-ai-based-real-time-feedback>

2. Prompts during calls

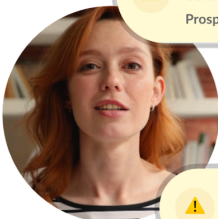

Whenever a call seems to be going down a path that will likely lead to suboptimal outcomes (like rep jumping into a demo too early), Poised can more proactively prompt the rep to take immediate action. We have learned when exactly to provide these nudges and how to prioritize them and personalize to each user in order to maximize their effectiveness while minimizing distractions.

The types of prompts Poised is able to provide can help with re-inforcing best practice processes, handling objections or improving clarity of communication.

Question suggestions that never miss the real pain

Aside reads buyer signals and prompts the exact next question so discovery goes deep and late stage surprises disappear.

Cluely AI

Frequently asked questions

Why real-time vs. a regular AI notetaker? ▼

Who is Cluely for? ▼

Is Cluely free? ▼

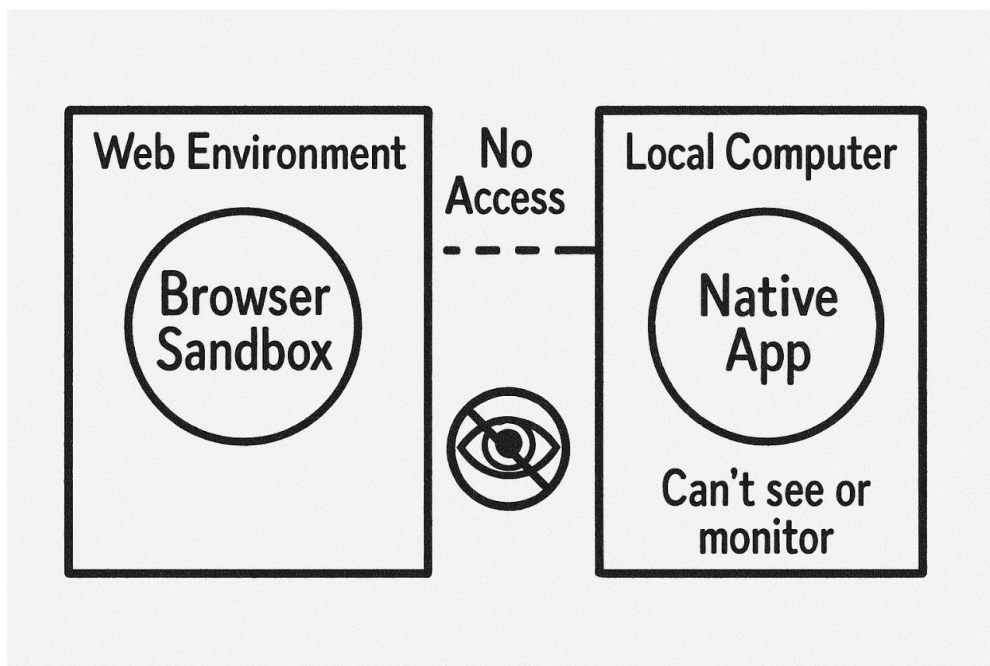

How is it undetectable in meetings? ^

Unlike other meeting AI tools, it never joins your calls as a participant, doesn't appear in meeting recordings, and won't show up in screen shares (limitations [here](#)). It captures meeting audio in the background and provides a discreet, translucent overlay that only you can see—making it completely undetectable to other meeting participants.

The Bottom Line

Because interviews run in secure browser tabs, and Cluely runs as a completely separate native application, standard detection methods simply can't see it. We designed it specifically with browser security limitations in mind.

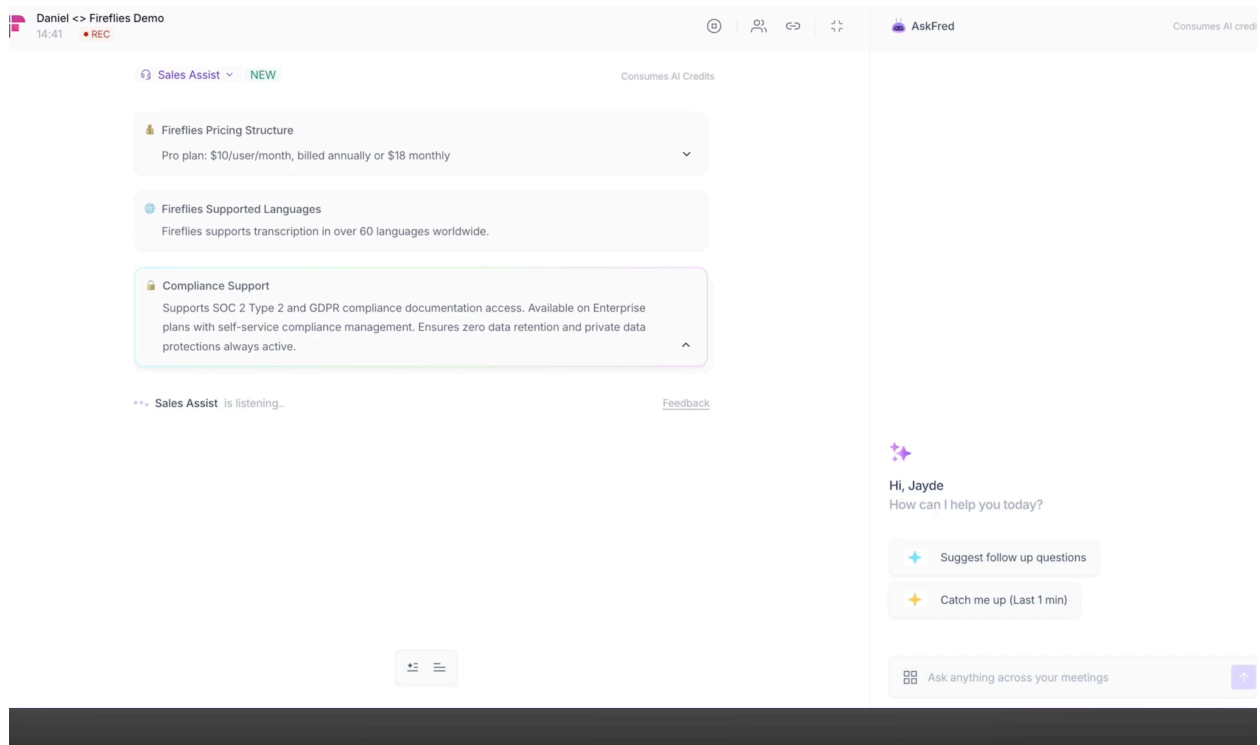

Until the day that companies require you to download and install a separate desktop app, or migrate completely to in-person interviews, Cluely will work.

Transcript

I have a flight coming up and had a quick question.

Visitor | 12:36pm

Hi Cassie, Thanks for being a loyal Gold Rewards customer. It will be my pleasure to assist you today.

Agent Shelly | 12:37pm

So, I'm going to San Diego to catch some waves. Can I bring my surfboard along with me?

Visitor | 12:37pm

AI generated answer

You can bring a surfboard if they're packed in board bags and:

- Weigh less than 100 pounds (45.3 kg)
- 155 total inches (length, + width + height) if you're flying Acme Air

If you're flying from California, we'll waive oversized bag charges for up to two items.

AI Answers

Agent Assist pulls data from your knowledge base, CRM, web, and top-performers to automatically surface answers during live conversations.

Will a pre-approval remain valid if the customer moves to another state?

AI Answer

Advise the customer that pre-approvals may not carry over across state lines. Check if the lender is licensed in the new state and reissue the letter if needed.

User Feedback

Not convinced with the Live AI Call Coaching Platforms

I will not promote. And, no I'm not building a tool/service. Simply asking from the hive.

I've seen and tested many and curious to other people's opinions.

Love the idea of a role playing tool. That's good and should reduce ramp time of new hires and ramp time of veterans on new products/ services, or specific conversations deeper in the funnel.

Where I am not convinced is the live coaching for a rep while they are on a call.

I don't believe in multi-tasking. For example one cannot easily sing the ABC song and at the same time quickly count backwards from 25. Our brains don't operate that way.

Back to the live coaching, by the time the tool actually processes the conversation and makes a suggestion, the conversation has moved further. For lack of a better phrase, the latency.

It's like the delay on auto-dialers. Someone calls and the prospect has to wait 1-3.

lessis_amess · 4mo ago

yes, totally agree. I tried the Cluely one and just the stuff it was coming up with was pretty useless. Like if I didn't know that stuff, I shouldn't be on a call with a prospect.

I could MAYBE see a case it's useful if you do an incredibly high volume of demos (>10 per week) and you can't remember anything about a prospect you spoke with 2 weeks ago. If it then gives me insight on what we spoke last. But even then, I can't believe you don't have 2 minutes before to get ChatGPT to summarise the previous meeting.

Interesting-Alarm211 OP · 4mo ago

Agreed about the previous conversation. However that's where I'd expect the tool to send that info to me before the sales call, you know?

DefinitionFit5468 · 3mo ago

Exactly, and it just feels so distracting to read through all that while maintaining the conversational flow. I would personally only like a few pointers and reminders at max on things that i maybe forgot or like a checklist which gets done as I keep doing those in the call. But again, a tool for it feels like an overkill.

Kundrew1 · 4mo ago

Its a dumb idea that sounds good in theory but is not practical at all.

Even if the advice is amazing you're going to have to stop your conversation and read the output the process how to relay that to the prospect. There is going to be some long delays that completely kill the conversation and make it feel robotic.

What I wouldnt mind would be a technical advice bot, say a client asks a technical question, instead of saying ill get back to you, it could look it up and give me the answer. That would be valuable.

6

CountFUPA · 4mo ago

Agreed. My question for anyone here is how useful AI is in your prep. I feel like everyone is using it to some degree. I also think, at some point, when the ball is in the air, you just gotta do your job and not rely on AI to tell you what to do next. My thought is that being even better prepped is the solution. Just tossing this out for thoughts.

plaitv · 4mo ago

I feel like if you need a bot in your ear telling you what to say you're in the wrong job. Talking is literally all you get paid for... Its one of these things that management buys bc it sounds great but provides much value. Might as well let the bot call prospects directly

3

3 more replies

tanbrit · 4mo ago

It sounds like a worse version of the annoying colleagues who send a load of teams messages with suggestions while you're presenting, only with more delay and a need to pause to read the output. Don't see it working honestly

2

brain_tank · 8mo ago

You're attacking a very real problem -- but you're late, vague, and under differentiated. Without a sharp wedge, this turns into a feature inside Gong, not a company. And if your AI starts spamming reps live during calls, expect a revolt.
